So first of all. There's no such thing as AMIBCP. This is a combination of AMIBIOS v7 and AMIBIOS v8. The thing AMIBIOS is a BSD operating system compatible with Microsoft Windows. So there's this tool called AMIBOOT.DLL which is an executable file and in it you will find a function called AMIBOOT_MainBOOT which is basically the function the BSD Kernel calls as well. So if you dig down through the official Microsoft source code (as well as a ton of other stuff) you will find something called ami6mboot_mainboot.asm. So basically AMIBOOT is a combination of v7 and v8. In bsodv7 you will find a module called amiboot.sys which is the main module of AMIBOOT.dll which is AMIBOOT.DLL. Which is a Windows 95/98 compatible program which can read and install a rom to the RAM of the server. This is why v7 won't work with v8. You just don't have the main module installed to get the rom to load. You need the module to do that and it does not come with the v8 kernel. But you have to realize that v7 is a completely different system and that AMIBOOT.DLL is the program that is used to load the rom. yes, it might be your own fault. I guess you did not save the edit, as you were a bit occupied by the first smt version. you should probably save the edit, and let the bmd file be saved, as it is common, that amibd uses the last save as the bmd save, if you already done some change. if you actually closed the bios and save this new edit, there will be no bmd save, as there is no bmd editor, that would just save the new edit. it is a dialog, not an edit box, where you enter new changes and save. you then have to close the bios, save the bmd file. exit your bios. and start up amibd again.
