There's an issue that should not be overlooked as far as Raw conversion goes. Whenever you choose "HDR Conversion", Raw files of any size show their "HDR" info in the file list. However, you can't open them unless you specify the "photo" and "dynamic range", and they don't appear in the main window's focus. Nevertheless, I do share the sentiment of most photographers when it comes to the rollout of the new batches of RAW files. When software like Lightroom is constantly dropping new batches of files for evaluation, all the jockeying to make the data available to the user and keeping everyone from being left out does not make me want to go through the hassle of uploading data to a different software package. Given the way that the "Data Storage" feature was implemented, Lightroom users can still download RAW files to their desktop using the built-in import features. There are certainly many other image editing tools available these days, but Photoshop remains the de facto standard. And it has not only been the de facto standard for more than 10 years, but is the best choice for seasoned pros and casual users. Nothing could be finer -- or more useful -- than a tool that allows you to create realistic facial expressions in video games. I recently started playing the iOS version of NBC Sports Now . It currently features some 20-odd events on the site, and it's a great cause of three days of frustration each week. The problem is, trying to watch the video of the game play, with accompanying play-by-play, and trying to compose a facial expression, at the same time, makes it close to impossible to predict a winner in a close game. The developer has a choice: Either expose the face of the player to his opponent or leave him out. If the player is visible, there's no way for the opponent to gauge his emotional state. If the player is hidden, he'd better not appear to be angry or the other team will score. Sad that the game has such obvious technical and basic human weaknesses.
